How to write a managerial report for statistics.

1 Write the summary of your report. If you were in an elevator with someone and were asked what your project was about, your summary is what you would tell that person to describe your project. Avoid citing any references you did not mention in your report. This is also where you will address any problems that your study may have done. 4 Present your results. This section provides analysis and defines your results within the overall context of your field or industry. If other work has been done in the field regarding the same topic or similar questions, it is also appropriate to include a brief review of that work after its introduction. Small graphs or graphs often show your results more clearly than you can write them in text. For example, if you compared your study to a similar study done in another city the previous year, you might want to include a citation from that report in your references. Immediately after your statistical report, you should include a table or list of books or articles that you used to complete your research, or that relate to the report itself. If you used any textbook material, a reference is enough; you don't need to summarize that material in your report. The introduction of your report identifies the purpose of your research or experiment. Instead, use "average", "median", or "mode", whatever is correct. Although your summary appears first in your report, it is often easier to write it last, after you have completed the entire report. 7 List your references. Usually, this will be the longest section of your report, with the most detailed statistics. If you had to make any adjustments during the development of the project, identify those adjustments and explain what requires you to make them. List any software, resources, or other materials you use in the course of your research. You usually want to away from reports. reports. that have nothing to do with your original expectations or hypotheses. It also will be the driest and most difficult section for your readers to get through, especially if they are not statisticians. Your report will have very little value if nobody who reads it understands what you did or what you achieved. Avoid overly scientific or statistical language in your abstract as much as possible. Avoid trade "terms of art" or industry jargon if your report will be read mainly by people outside your particular industry. 8 Keep your audience in mind. However, if you discovered something startling and unexpected through your research, you may want to at least mention it. However, if you didn't end up directly citing any of those sources in your report, there's no need to list them in your references. Even if you're writing your statistical report as an assignment for a class, you likely should write it for a more general audience. Cite your references using the appropriate citation method for your discipline or field of study. Include a description of any particular methods you used to track results, particularly if your experiments or studies were longer-term or observational in nature. Explain to the reader why you undertook this particular project, including the questions you hoped to answer. 6 Discuss any problems or issues. Explain why your work is different or what you hope to add to the existing body of work through your research. Make sure the terms of art and statistical terms that you do use in your report are used correctly. You also should indicate to the reader whether your findings matched your initial hypotheses. Any speculation you have, or additional questions that came to mind over the course of your study, also are appropriate here. 5 State your conclusions. Aim for clear and concise language to set the tone for your report. It can help to think of your abstract as an elevator pitch. Just make sure you it to a minimum eAAA you don't want your personal opinions and speculation to overtake the project itself. Put your project in layperson's terms rather than using overly statistical language, regardless of the target audience of your report. If your report is based on a series of scientific experiments or data drawn from polls or demographic data, state your hypothesis or expectations going into the project. 3 Describe the research methods you used. When you get to this section of your report, leave the heavy, statistical language behind. Start with your main results, then include subsidiary results or interesting facts or trends you discovered. Report the specific findings of your research or experiment. Since the scientific method is designed so that others can repeat your study, you want to pass on to future researchers your insights. Advertisement If your findings relate to or contradict any previous studies, talk about this at the end of your report. 2 Draft your introduction. Your abstract should be understandable to a larger audience than those who will be reading the entire report. It is often the case that you see things in hindsight that would have made data-gathering easier or more efficient. Use this section of your report to provide a detailed account of how you went about your project, including the nature of any experiments conducted or the methods you used to collect raw data. The abstract is a brief description, typically no longer than 200 words or so, that summarizes all elements of your project, including the research methods used, the results, and your analysis. For example, you shouldn't use the word "average" in a statistical report because people often use that word to refer to different measures. If any additional research or study is necessary to further explore your hypotheses or answer questions that arose in the context of your project, describe that as well. For example, you may have A preparing background reading for your project. This section of its report should be only made, without any analysis or discussion of what these facts could mean. This section must be easy to understand for anyone, even if the results section skipped out. This is the place to discuss those. those.
